

Is There A Use with regard to Pheromones?

Now I'm not sure if you have ever heard of **pheromones** but there is such a thing. Pheromones as they exist in nature are chemical activates which are secreted by animals which may result in a change in the behavior of some other animal. These chemicals are secreted by numerous glands at various times of the life of the animal. They can be triggered to be able to modulate sexual behavior. Have you ever heard of the statement of a dog in heat? When a female is ovulating and at the time of reproduction male dogs will observe her so that you can lover with her. This only happens at certain times. The key is the release of **chemical compounds** by the female which alerts the males of her condition.

Pheromones Also Affects Lack of Control Levels in Animals

An aggressive animal may emit chemicals which alerts other animals of the intense intent. They are also used to mark the territory of a dominant male. This alerts the other males that they have entered his place along with the females of the species.

Human Beings the Skin is the Organ Which Releases the Pheromones

Their release begins during puberty when the **human body** begins to produce most of the hormones that are associated with growth and sexuality and also are released by glands in your skin.

We as people cannot perceive an smell. Some may confuse the body odor that is produced by the breaking down of glandular secretions by bacteria with the production of pheromones but they are two different things.

Studies have been done in humans pertaining to the production of pheromones in women and men which seem to indicate heightened production of these kinds of chemical compounds in men and women at the time of ovulation. Studies have also shown that the production of pheromones will also change in women when they are placed in the company of women or all men.

- The perfume industry has capitalized on the production and function of pheromones for quite a few years.
- I am not sure if pheromones can be added to fragrance as some claim for many reasons.
- The first of which is that they are produced naturally by our body.
- Any attempt to duplicate them in a laboratory is questionable.
- It might be possible but as far as I'm concerned that is highly questionable.
- Is it possible to reproduce the precise chemical permutations found in nature?
- Maybe it is but it is highly doubtful.

When the data of pheromones was relatively new there would be commercials on television advertising their use as well as effects when used in perfumes and colognes but have you noticed that these advertisements have all but disappeared. I just don't believe that these effects can be replicated and put in a perfume or cologne.

Many Years Ago I Owned a Store Establishment on an Army Installation in Georgia

One year many of the troops there had been deployed to Egypt with regard to a long training exercise. When they came back many of them have been asking me for a fragrance called Secret of the Desert. Their claim was that when they utilized this perfume it actually caused women to become receptive in order to sexual intercourse. There were so many who stated that they had used this fragrance and that it had actually worked for them in which I decided that it was worth looking into.

When i would some research I discovered this fragrance listed as one of the scented oil scents sold by Egyptian vendors. The fragrance which was known as Secret of the Desert was none other than their version of Channel #5. The particular hype has been created by the vendors in order to make a lot more sales to the gullible soldiers and also the Egyptians utilized sex as a selling application. In light of this I would advise you to be able to be wary of any scented product which promises that it will cause the opposite sex to be attracted to a person. Fragrance Essential oil Express.
