

## The Effectiveness of Pheromones in Attraction

According to many scientists, human attraction is not always about the appearance of a person. Sure males would usually examine beautiful women, while women would look at handsome men, but not all destination are physical. Many scientists and researchers have agreed **human pheromones** also play a major role in attraction, because of one-night-stands or for passionate love.

How **Pheromone** Operates Pheromone is a secreted or excreted chemical ingredient that sparks a social response in members of the same species. Although more commonly known among animals and insects, humans also contain the same chemical which can also affect the behavior of other humans, specifically among the opposite sex.

- Existence of Human Pheromones The existence of man pheromones has been widely discussed by many scientists over years.
- One case had been that of Martha McClintock where in her study, female human pheromones can affect the menstrual cycle of another girl.

### This Study Exposed a Group of Women to a Whiff of Perspiration from Other Women

It was discovered that it caused their menstrual cycles to speed up or slow down depending on the time in the month the sweat was collected: before, during, or after ovulation. Therefore, this examine proposed that there are two types of pheromone involved: "One, created prior to ovulation, shortens the actual ovarian cycle; and the second, produced just at ovulation, and lengthens the cycle".

### True Pheromones

Pheromones are good at altering people's actions. There are a few types of pheromones, each with separate purposes. A number of such responses include a signal for food, danger, and sex. Different types of pheromones have different influences on the response. Learn more about true pheromones for Men to Attract Women.

Another study is that human pheromones are categorized as androstenone, androstenol, and androstandienone, which are types of steroids produced by the testes, ovaries, apocrine glands and adrenals.

“

*How to tell that She's Not Into You Rejection comes in many forms. There is the polite and firm no and there is the subtle no . Then there is maybe . This third one is perhaps, most difficult to deal with, since the mixed signals could foster some hope that the situation may yet...*

The Androstenol is a putative **female pheromone** that causes happiness. The androstenone, on the other hand, is considered in order to affect epidermis conductance. It is also been found to be perceived as more pleasant to men with a woman's time of ovulation. It is hypothesized that this may be a way for a male to be able to detect a good ovulating woman who would be more willingly to be associated with sexual interaction.

The **androstadienone** is said to be able to affect the limbic system and also causes a positive effect in women, often improving their moods. Though women tend to react positively with androstadienone, men are more negative.

*Effectiveness of Human Pheromones in Attraction As for attraction, the study done by Culter found that there is an increase in sexual behavior in the pheromone consumers, which was the basis of the creation of pheromone cologne, than these that doesn't.*

Another is that study by McCoy and Pitino which was similar to the Culter study, though only females rather than males were subjects. Females treated with female pheromones reported significant increases in many of the behaviors including 'sexual intercourse', 'sleeping close to a partner', 'formal dates', and 'petting/affection/kissing'.
